

KeyVis for DOORS

Traceability is an essential feature of IBM® Rational® DOORS®. As the depth and breadth of your traceability increases, understanding and visualising large amounts of linked information becomes a real challenge.

KeyVis™ is a DOORS customisation that enables you to visualise traceability by exporting diagrams into Microsoft Excel. In the diagrams, DOORS objects are shown as shapes, and links as connectors.

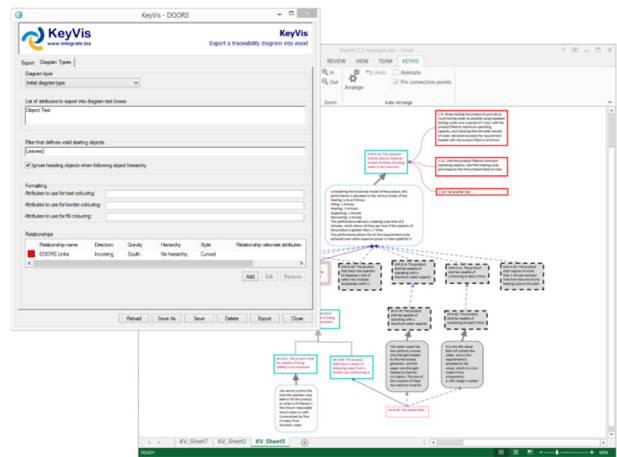

Not Just A Pretty Picture

With the many export options available in KeyVis, you can tailor each diagram to suit a particular task: design reviews, traceability reviews, impact analysis, V&V analysis, etc. And the powerful features of Excel - extended by the KeyVis graph analysis tools - are available to edit, manipulate, enhance and analyse the traceability diagrams.

KeyVis allows you to save export settings as diagram types, so that you and other users can easily reproduce types of diagram that reflect your processes. You can also create diagrams incrementally by merging new traceability data into existing diagrams.

Complete Solution

KeyVis provides everything you need to start working with traceability diagrams. Not only does the DOORS customisation allow you to configure and generate the diagrams, but KeyVis also provides tools for working with the diagrams once in Excel, including automatic diagram layout.

Benefits

- Provides visualisation of complex traceability relationships within your information model
- Visualisation environment is widely available and diagrams can be analysed and enhanced using standard Microsoft Excel features

Features

- Many export options: start point, direction, depth, relationships, indirect tracing, attributes, baselines, colours, etc
- Layout auto-arrange function
- Diagram merging function
- Supports your information model and process
